

Presentation  
On  
Summer Training Project Report  
titled as  
**‘EMBEDDED SYSTEMS/8051  
MICROCONTROLLER’**

# Different types of systems:

## 1. Open system:

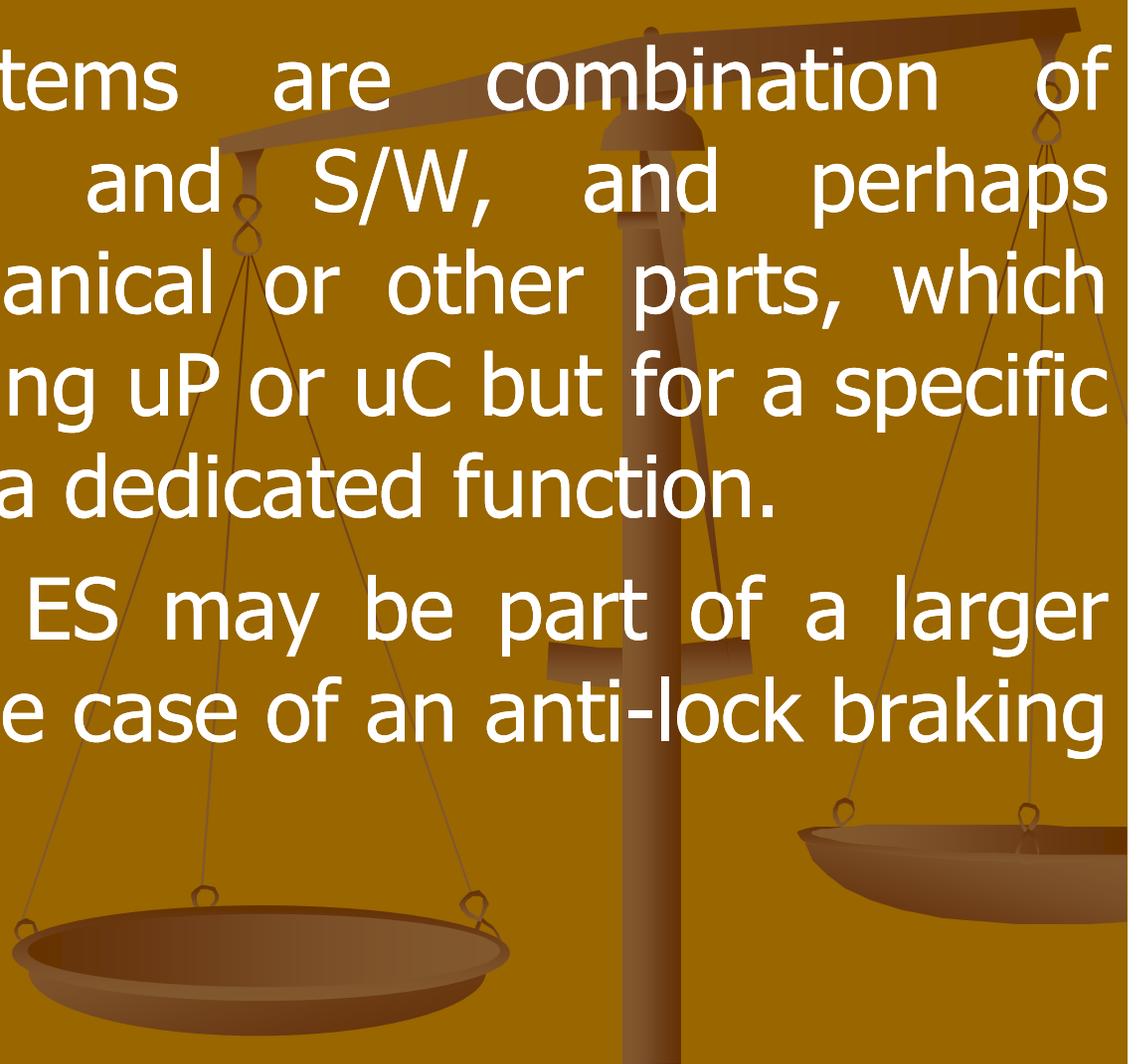

where you can use it for various task.  
For e.g., personal computer.

## 2. Embedded system:

where you can use it for specific task.it contains special purpose compute within the device, and is designed with various funtions .For e.g. microwave.

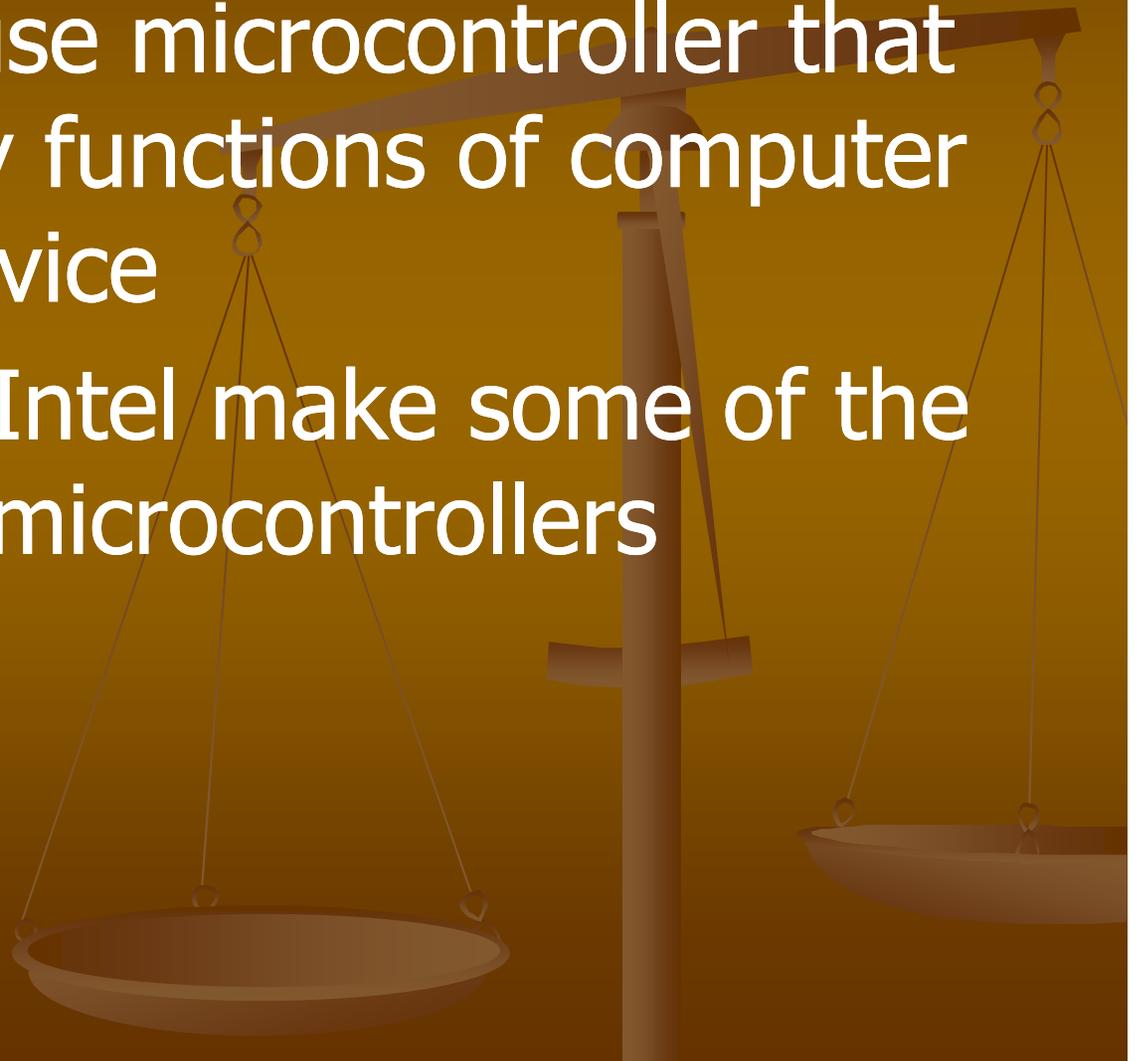

# EMBEDDED SYSTEMS

- Embedded systems are combination of computer H/W and S/W, and perhaps additional mechanical or other parts, which are designed using uP or uC but for a specific task to perform a dedicated function.
- In some cases, ES may be part of a larger system , as is the case of an anti-lock braking system in a car.

# EMBEDDED SYSTEMS

- ES generally use microcontroller that contains many functions of computer on a single device
- Motorola and Intel make some of the most popular microcontrollers

# EMBEDDED SYSTEM DEVICES

## CONSUMER ELECTRONICS

Microwave Ovens

Digital Cameras

DVD Player

Washing Machine

## TELECOMMUNICATION

Switches

Cellular Phones

## PLANT CONTROL

Robots

Industrial Process control

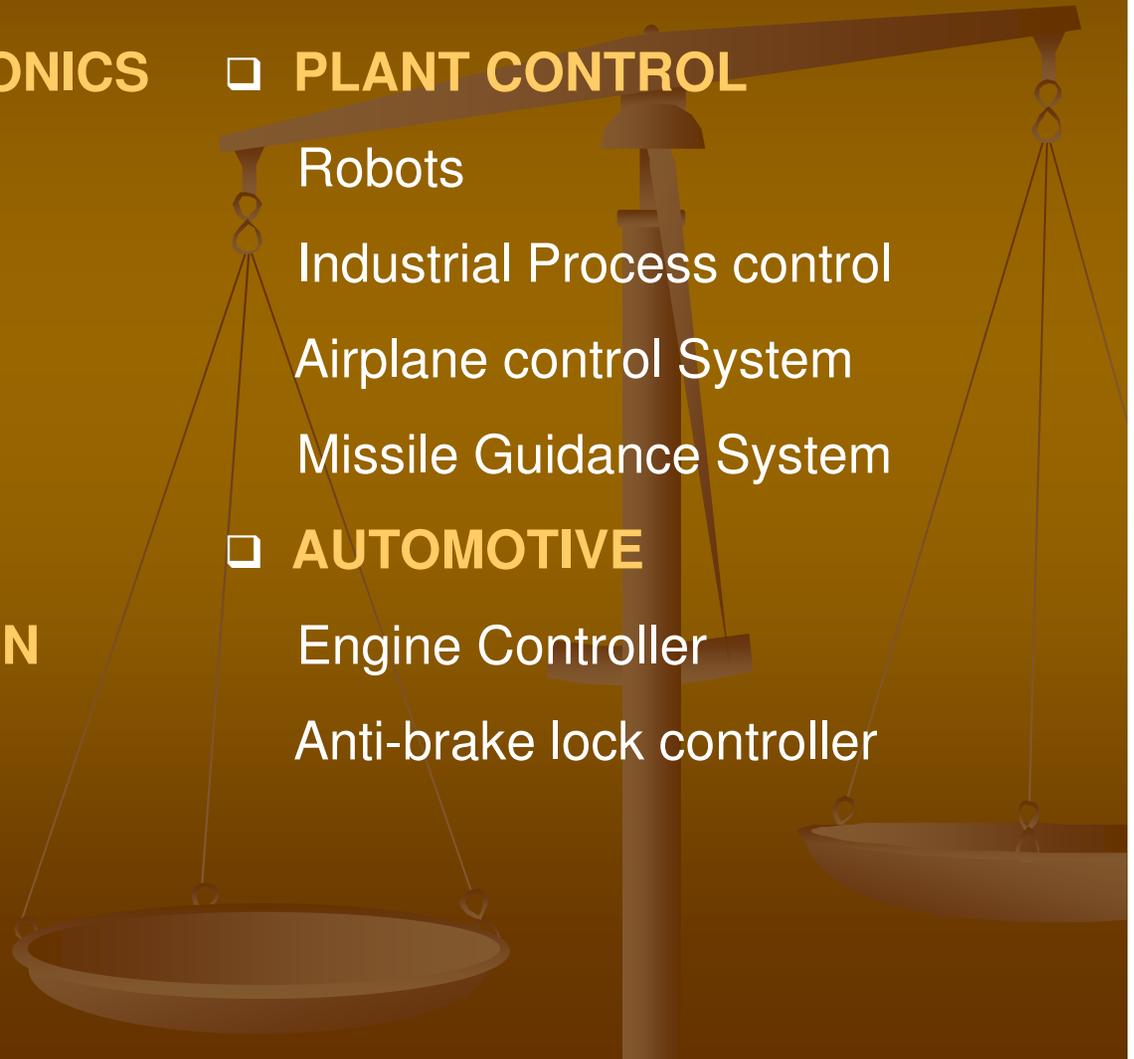

Airplane control System

Missile Guidance System

## AUTOMOTIVE

Engine Controller

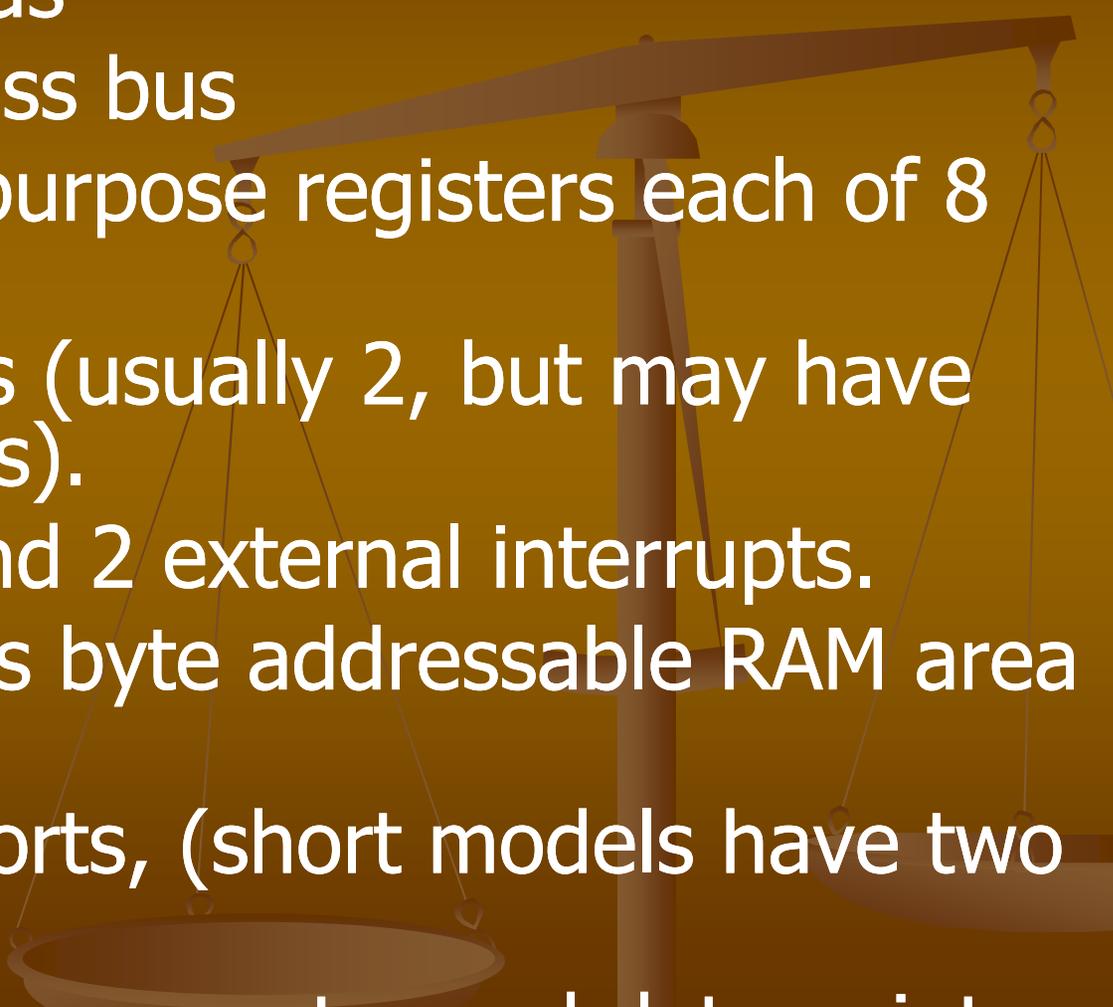

Anti-brake lock controller

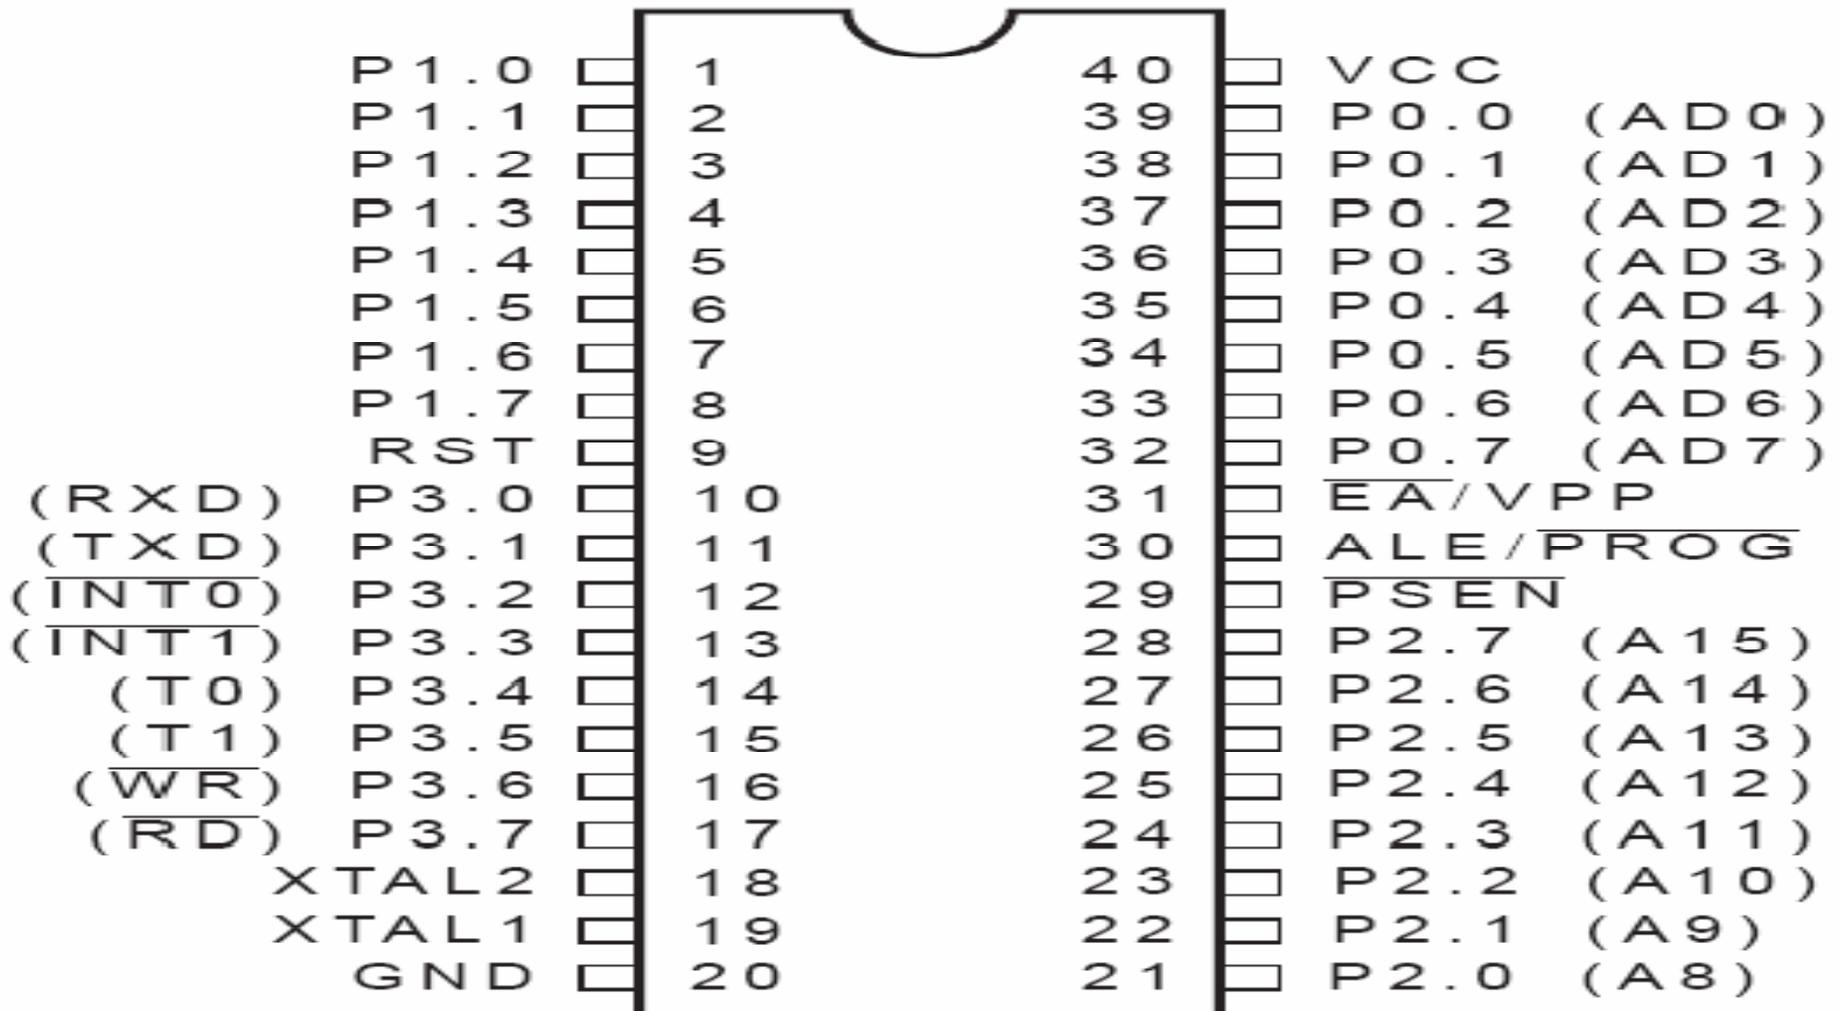

## Percentage share of various verticals in Embedded Software market

|                       |     |
|-----------------------|-----|
| Datacom               | 34% |
| Consumer Electronics  | 20% |
| Industrial Automation | 19% |
| Automotives           | 10% |
| Office Automation     | 8%  |

# Some feature that makes 8051 popular

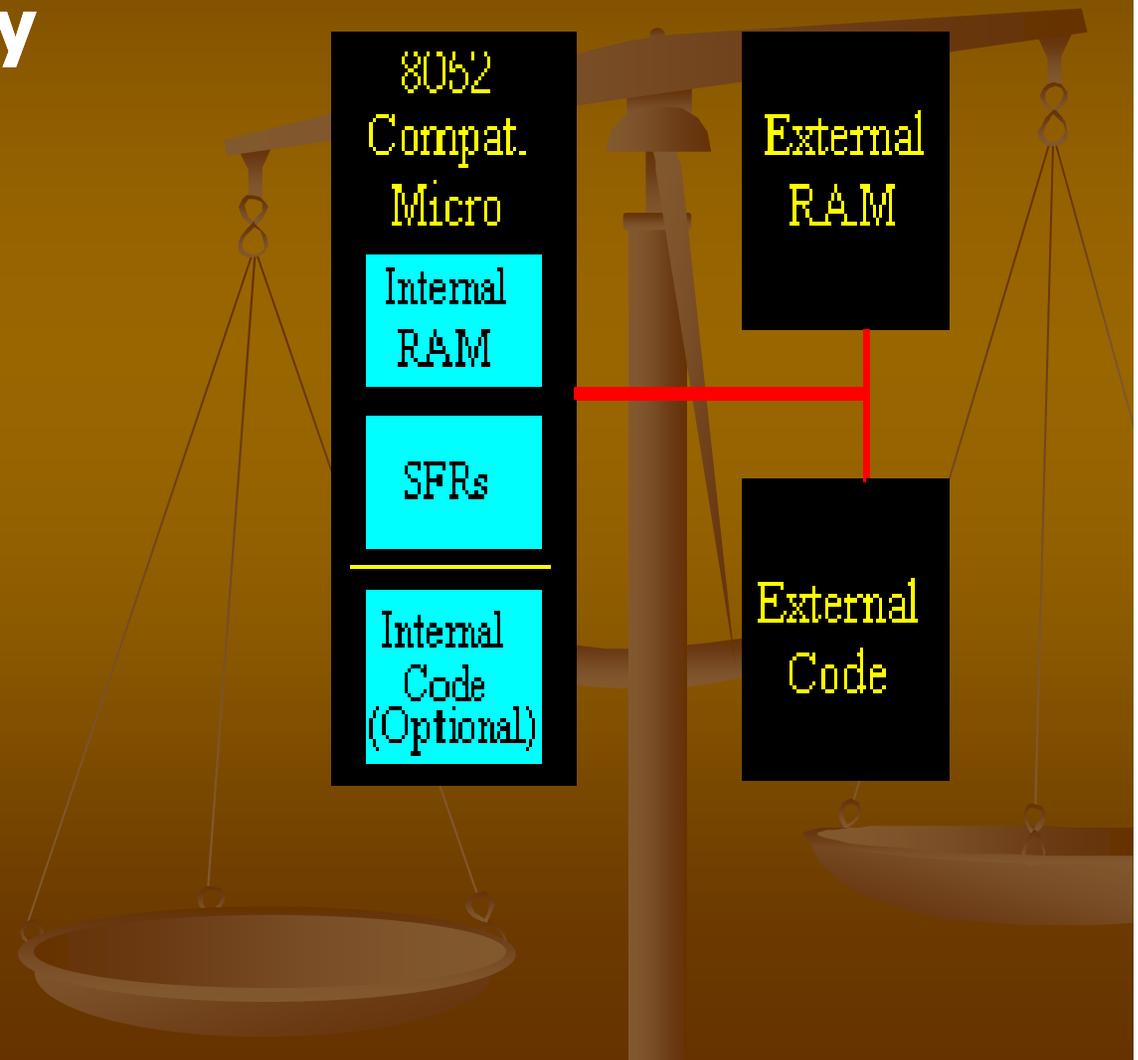

- 8-bit data bus
  - 16-bit address bus
  - 34 general purpose registers each of 8 bits
  - 16 bit timers (usually 2, but may have more, or less).
  - 3 internal and 2 external interrupts.
  - Bit as well as byte addressable RAM area of 16 bytes.
  - Four 8-bit ports, (short models have two 8-bit ports).
  - 16-bit program counter and data pointer
- 

# PIN DIAGRAM OF 8051

# TYPES OF MEMORY

- On-Chip Memory
- External Code Memory
- External RAM

# On chip memory

SFRs

⋮  
⋮  
⋮

It has four parts on which it can be explained :

- Register banks- R0,R1,R2 and R4

are basically used to manipulate data from one memory to another memory place.

- BIT MEMORY

gives the user the ability to access a number of *bit variables*.

There are 128 bit variables available to the user, numbered 00h through 7Fh

- GENERAL PURPOSE REGISTERS

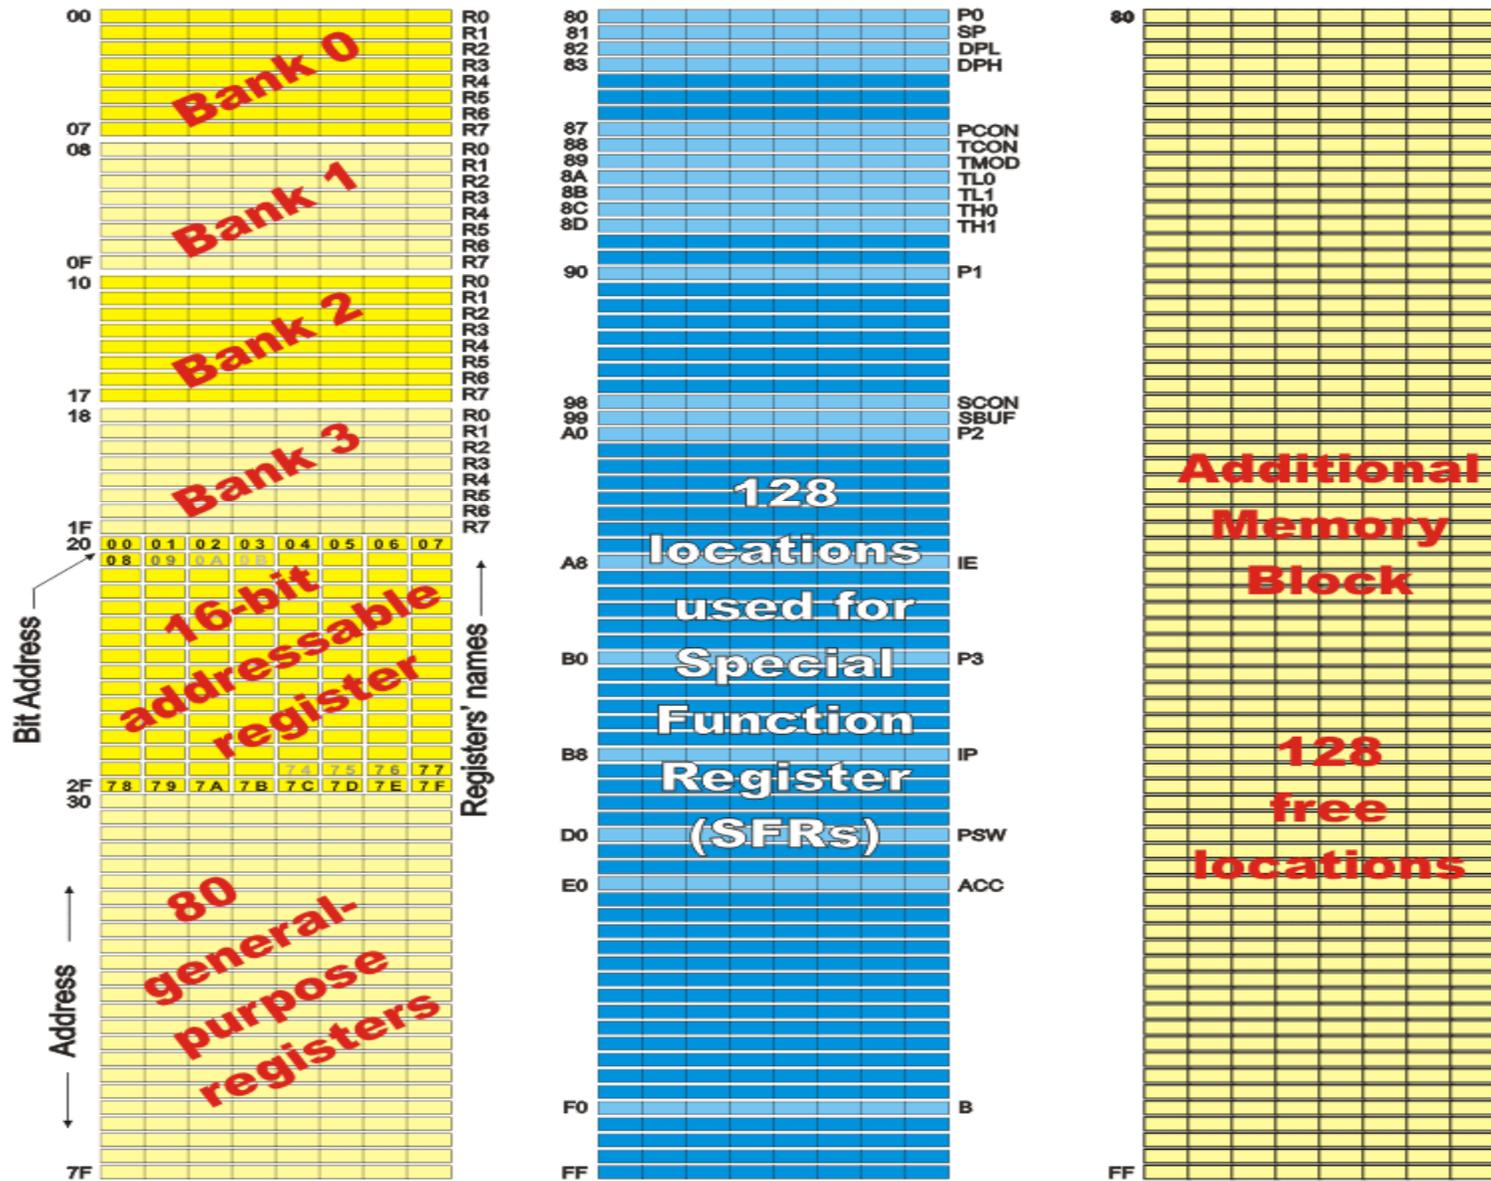

use to store memory addresses and data

- SPECIAL FUNCTION REGISTER(SFR)

Special Function Registers (SFRs) are areas of memory that control specific functionality of the 8051 processor . Four SFRs permit access to the 8051s 32 input/output lines .

Later versions of the 8051 microcontrollers  
(256 general-purpose registers)

Previous versions of the 8051 microcontrollers  
(128 general-purpose registers)

Blue background are I/O port SFRs  
 Yellow background are control SFRs  
 Green background are other SFRs

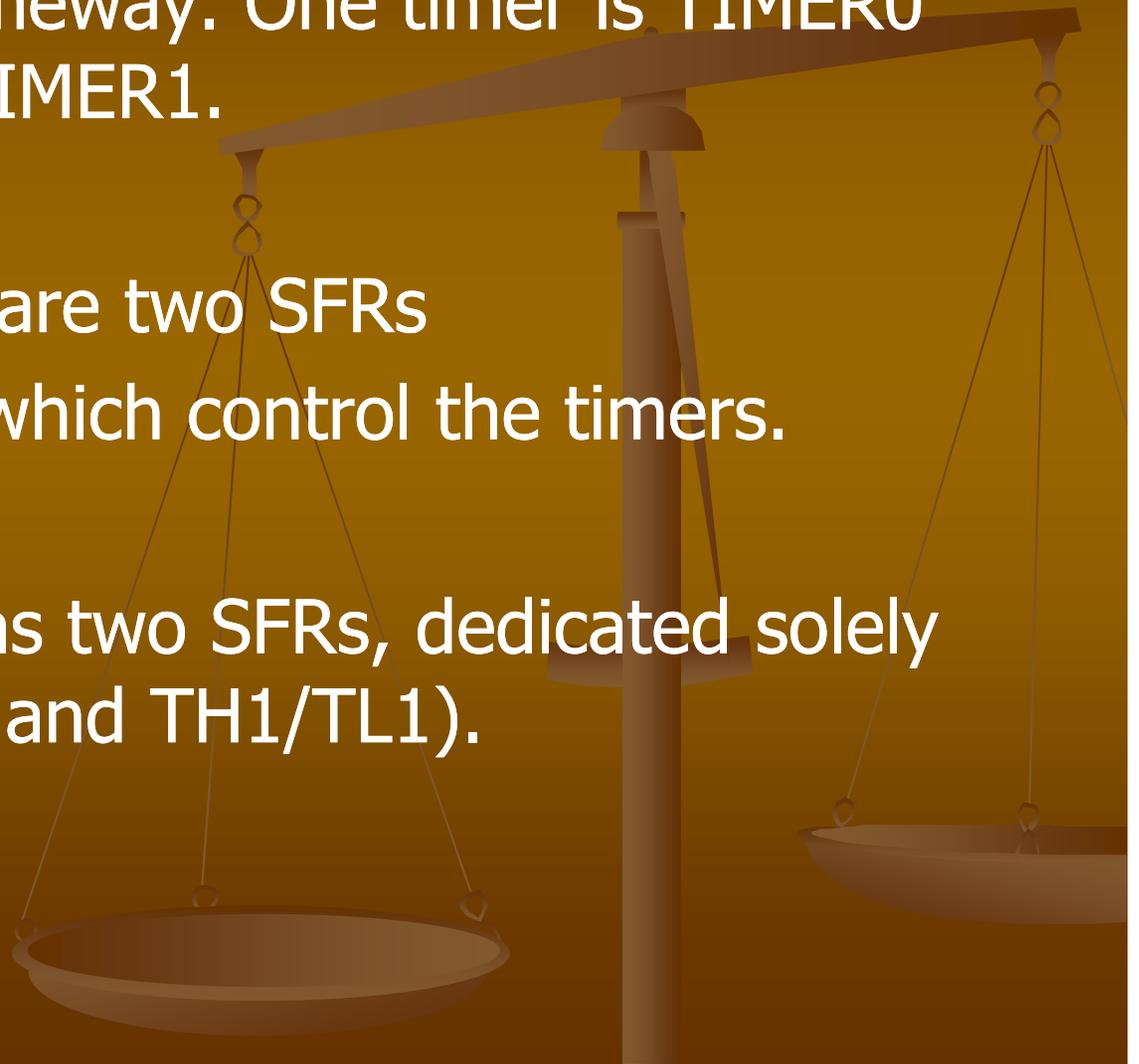

# TIMER

The 8051 comes equipped with two timers, both of which may be controlled, set, read, and configured individually. The 8051 timers have three general functions:

- 1) Keeping time and/or calculating the amount of time between events,
- 2) Counting the events themselves,
- 3) Generating baud rates for the serial port.

# Timer SFRs

- The 8051 has two timers which each function essentially the same way. One timer is TIMER0 and the other is TIMER1.
- The two timers share two SFRs (TMOD and TCON) which control the timers.
- Each timer also has two SFRs, dedicated solely to itself (TH0/TL0 and TH1/TL1).

# Timer SFR'S

| SFR Name | Description       | SFR Address |
|----------|-------------------|-------------|
| TH0      | Timer 0 High Byte | 8Ch         |
| TL0      | Timer 0 Low Byte  | 8Ah         |
| TH1      | Timer 1 High Byte | 8Dh         |
| TL1      | Timer 1 Low Byte  | 8Bh         |
| TCON     | Timer Control     | 88h         |
| TMOD     | Timer Mode        | 89h         |

# TIMER MODES

| TxM1 | TxM0 | Timer Mode | Description of Mode |
|------|------|------------|---------------------|
| 0    | 0    | 0          | 13-bit Timer.       |
| 0    | 1    | 1          | 16-bit Timer        |
| 1    | 0    | 2          | 8-bit auto-reload   |
| 1    | 1    | 3          | Split timer mode    |

# TMOD SFR'S

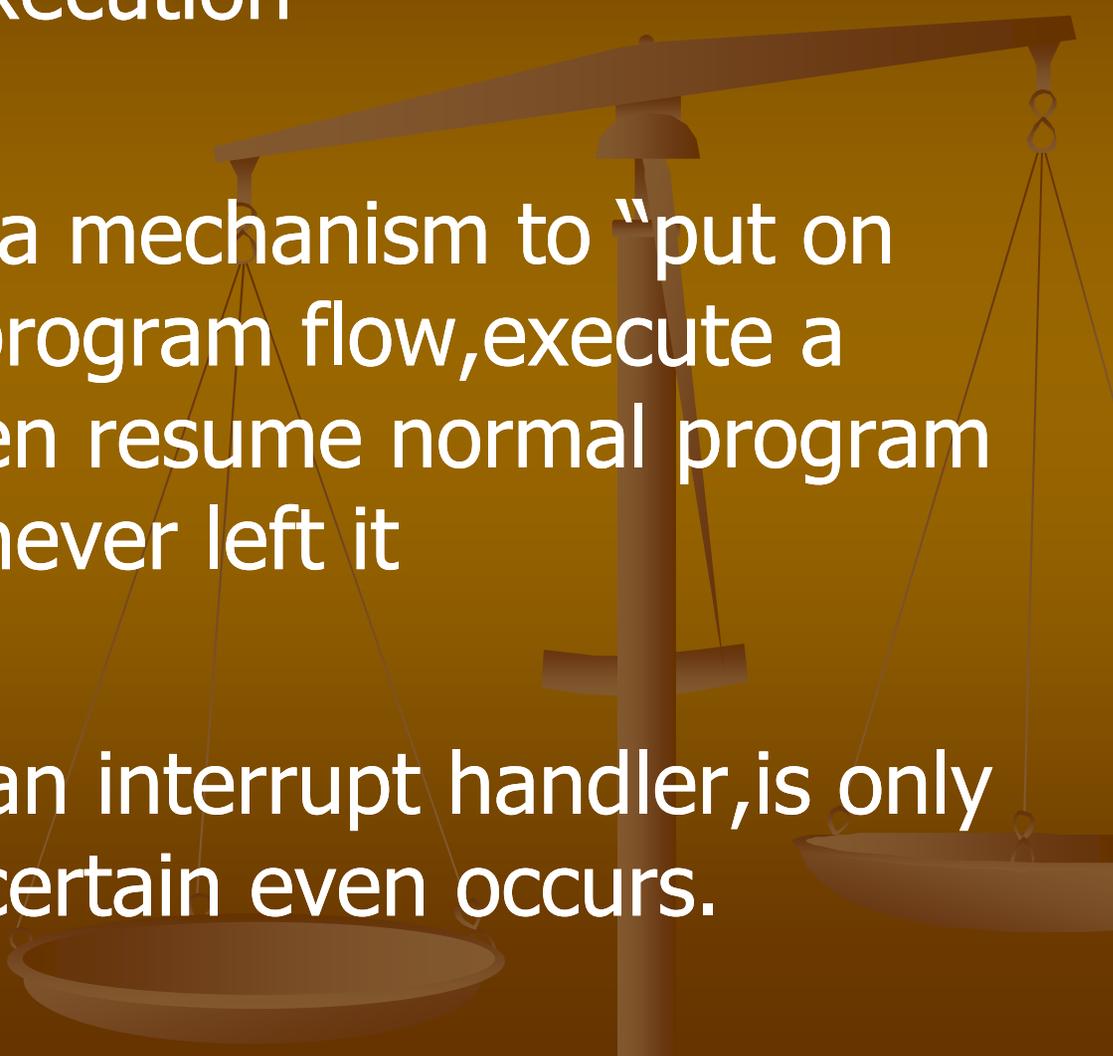

| Bit | Name  | Explanation of Function   | Timer |
|-----|-------|---|-------|
| 7   | GATE1 | When this bit is set the timer will only run when INT1 (P3.3) is high. When this bit is clear the timer will run regardless of the state of INT1. | 1     |
| 6   | C/T1  | When this bit is set the timer will count events on T1 (P3.5).<br>When this bit is clear the timer will be incremented every machine cycle.       | 1     |
| 5   | T1M1  | Timer mode bit (see below)  | 1     |
| 4   | T1M0  | Timer mode bit (see below)  | 1     |

|   |       |   |   |
|---|-------|---|---|
| 3 | GATE0 | When this bit is set the timer will only run when INT0 (P3.2) is high. When this bit is clear the timer will run regardless of the state of INT0. | 0 |
| 2 | C/T0  | When this bit is set the timer will count events on T0 (P3.4).<br>When this bit is clear the timer will be incremented every machine cycle.       | 0 |
| 1 | T0M1  | Timer mode bit (see below)  | 0 |
| 0 | T0M0  | Timer mode bit (see below)  | 0 |

# TCON SFR'S

| Bit | Name | Bit Address | Explanation of Function   | Timer |
|-----|------|-------------|---|-------|
| 7   | TF1  | 8Fh         | <b>Timer 1 Overflow.</b> This bit is set by the microcontroller when Timer 1 overflows.               | 1     |
| 6   | TR1  | 8Eh         | <b>Timer 1 Run.</b> When this bit is set Timer 1 is turned on. When this bit is clear Timer 1 is off. | 1     |
| 5   | TF0  | 8Dh         | <b>Timer 0 Overflow.</b> This bit is set by the microcontroller when Timer 0 overflows.               | 0     |
| 4   | TR0  | 8Ch         | <b>Timer 0 Run.</b> When this bit is set Timer 0 is turned on. When this bit is clear Timer 0 is off. | 0     |

# Interrupt

- An interrupt is some event which interrupts normal program execution
  - Interrupts give us a mechanism to “put on hold” the normal program flow, execute a subroutine, and then resume normal program flow as if we had never left it
  - Subroutine called an interrupt handler, is only executed when a certain even occurs.
- 
- A faint, stylized illustration of a balance scale is visible in the background of the slide. The scale is positioned on the right side, with its beam extending towards the left. The pans are empty, and the overall image is rendered in a dark brown color that blends with the slide's background.

# 8051 Microcontroller Interrupts

- There are five interrupt sources for the 8051, which means that they can recognize 5 different event that can interrupt regular program execution.
- Event may be one of the timers "overflowing", receiving a character via the serial port, transmitting a character via the serial port or one of the two "external events"
- Each interrupt can be enabled or disabled by setting bits in the IE register. Also, as seen from the picture below the whole interrupt system can be disabled by clearing bit EA from the same register.

# IE SFR

| Bit | Name | Bit Address | Explanation of Function         |
|-----|------|-------------|---------------------------------|
| 7   | EA   | AFh         | Global Interrupt Enable/Disable |
| 6   | -    | AEh         | Undefined                       |
| 5   | -    | ADh         | Undefined                       |
| 4   | ES   | ACh         | Enable Serial Interrupt         |
| 3   | ET1  | ABh         | Enable Timer 1 Interrupt        |
| 2   | EX1  | AAh         | Enable External 1 Interrupt     |
| 1   | ET0  | A9h         | Enable Timer 0 Interrupt        |
| 0   | EX0  | A8h         | Enable External 0 Interrupt     |

# INTERRUPT HANDLING

| Interrupt  | Flag  | Interrupt Handler Address |
|------------|-------|---------------------------|
| External 0 | IE0   | 0003h                     |
| Timer 0    | TF0   | 000Bh                     |
| External 1 | IE1   | 0013h                     |
| Timer 1    | TF1   | 001Bh                     |
| Serial     | RI/TI | 0023h                     |

# SERIAL INPUT/OUTPUT PORT

One of the 8051's many powerful features is its integrated *UART*, otherwise known as a serial port. The fact that the 8051 has an integrated serial port means that you may very easily read and write values to the serial port. If it were not for the integrated serial port, writing a byte to a serial line would be a rather tedious process requiring turning on and off one of the I/O lines in rapid succession to properly "clock out" each individual bit, including start bits, stop bits, and parity bits. However, we do not have to do this. Instead, we simply need to configure the serial port's operation mode and baud rate. Once configured, all we have to do is write to an SFR to write a value to the serial port or read the same SFR to read a value from the serial port.

The 8051 will automatically let us know when it has finished sending the character we wrote and will also let us know whenever it has received a byte so that we can process it. We do not have to worry about transmission at the bit level--which saves us quite a bit of coding and processing time.

# SCON SFR

| Bit | Name | Bit Address | Explanation of Function   |
|-----|------|-------------|---|
| 7   | SM0  | 9Fh         | Serial port mode bit 0  |
| 6   | SM1  | 9Eh         | Serial port mode bit 1.   |
| 5   | SM2  | 9Dh         | Multiprocessor Communications Enable (explained later)                |
| 4   | REN  | 9Ch         | Receiver Enable. This bit must be set in order to receive characters. |
| 3   | TB8  | 9Bh         | Transmit bit 8. The 9th bit to transmit in mode 2 and 3.              |
| 2   | RB8  | 9Ah         | Receive bit 8. The 9th bit received in mode 2 and 3.                  |
| 1   | TI   | 99h         | Transmit Flag. Set when a byte has been completely transmitted.       |
| 0   | RI   | 98h         | Receive Flag. Set when a byte has been completely received.           |

| SM0 | SM1 | Serial Mode | Explanation          | Baud Rate           |
|-----|-----|-------------|----------------------|---------------------|
| 0   | 0   | 0           | 8-bit Shift Register | Oscillator / 12     |
| 0   | 1   | 1           | 8-bit UART           | Set by Timer 1 (*)  |
| 1   | 0   | 2           | 9-bit UART           | Oscillator / 32 (*) |
| 1   | 1   | 3           | 9-bit UART           | Set by Timer 1 (*)  |

THANK YOU
